Core Business System Overview

1. Document Objective

This document provides an overview of the insurance company's core business systems, helping technical staff understand each system's responsibilities, boundaries, and key business processes. It targets new developers, architects, and technical staff collaborating with business units.

2. Insurance Core Business Landscape

2.1 Business Lifecycle

Product Design → Sales → Application → Underwriting → Payment → Policy Issuance → Policy Management → Renewal → Claims → Contract Termination

Phase	Core Activities	Supporting System
Product Design	Definition, pricing, clause generation	Product Center
Sales	Channel promotion, customer reach, quotes	Channel Center, CRM
Application	Info entry, health declaration, document upload	Underwriting Center
Underwriting	Auto/manual risk assessment	UW Engine
Payment	First premium collection, payment channel	Payment Center
Issuance	Policy generation, e-policy delivery	Underwriting Center
Policy Management	Endorsement, cancellation, reinstatement	Servicing Center
Renewal	Renewal reminders, grace period	Renewal Center
Claims	FNOL, investigation, assessment, settlement	Claims Center
Termination	Maturity benefit, surrender	Servicing/Payment Center

3. Key Data Relationships

3.1 Customer → Policy

One customer → Multiple policies
 One policy → Multiple insured persons
 One policy → Multiple beneficiaries
 One policy → Multiple coverages (base + riders)
 One policy → Multiple payment records
 One policy → Multiple servicing/claims records

3.2 Field Definitions

All core systems follow unified field definitions for shared data elements.

4. Inter-system Interface Principles

1. **Acyclic Dependencies:** Core data flow follows a directed acyclic graph
2. **Event Notification:** State changes notify downstream via domain events
3. **Data Ownership:** Each atomic data element is maintained by exactly one system
4. **Idempotent Design:** All write interfaces support idempotent retries
5. **Eventual Consistency:** Cross-system states reconciled via batch reconciliation
